Do you need a power supply for a refrigerated shipping container?

When installing a refrigerated shipping container (also known as a reefer unit), it's essential to understand the power supply requirements to ensure safe and reliable operation. These containers are fitted with integrated cooling systems that must run continuously to maintain a stable internal temperature. Below is a breakdown of what's required.

How much power does a refrigerated container use?

Connect your refrigerated container to a 32amp, 415v power outlet, then tighten the locking ring. A 20amp outlet may not be suitable under extreme conditions, and is not recommended. 3. Refrigerated container power usage Your refrigerated shipping container will use approximately 18 amps on start up and continue to use 8 amps while running. 4.

What is the standard power supply voltage?

The standard supply voltage is 440/460 volts. Units can also operate with 208/230 volt three-phase transformers and are compatible with both 50 and 60 Hz frequencies. Grounding and Circuit Protection: A grounded power supply is mandatory for safety.

How many amps does a power supply need?

Power supply must have circuit breakers of a minimum of 30 amps. If your power supply is 230 (260-200) Volts, then the power supply (container) must be grounded and have circuit breakers of 50 amps per phase. Unit comes equipped with internal circuit breakers in case of power surges.
