---

Modern commercial wind turbines produce electricity by using rotational energy to drive an electrical generator. They are made up of one or more blades attached to a rotor and an ...

Put simply, they use the power of the wind to create electricity. Large wind turbines are the most visible, but you can also buy a small wind turbine for individual use; for example to provide power to a ...

Wind power is the use of wind energy to generate useful work. Historically, wind power was used by sails, windmills and windpumps, but today it is mostly used to generate electricity.

Wind turbines harness kinetic energy from air currents, converting it into mechanical energy as the blades turn. This mechanical energy is then transformed into electrical energy through ...

Wind energy, or wind power, is created using a wind turbine, a device that channels the power of the wind to generate electricity. The wind blows the blades of the turbine, which are ...

Wind turbines work on a simple principle: instead of using electricity to make wind--like a fan--wind turbines use wind to make electricity. Wind turns the propeller-like blades of a turbine around a rotor, ...

This is what generates electricity, which is then transferred to the grid to be used in homes, businesses, etc. The larger the blades and higher the wind speed, the more electricity the ...

Overview  
Wind energy resources  
Wind farms  
Wind power capacity and production

Small-scale wind power  
Impact on environment and landscape  
Politics  
Wind power is the use of wind energy to generate useful work. Historically, wind power was used by sails, windmills and windpumps, but today it is mostly used to generate electricity. This article deals only with wind power for electricity generation. Today, wind power is generated almost completely using wind turbines, generally grouped into wind farms and connected to the electrical grid.

# What does a wind power station use to generate electricity

Wind turbines use blades to collect the wind's kinetic energy. Wind flows over the blades creating lift (similar to the effect on airplane wings), which causes the blades to turn.

A wind turbine works by catching the energy in the wind, using it to turn the blades, and converting the energy to electricity through a generator in the part of the turbine called a nacelle. While some ...

It's a fairly simple process: When the wind blows, the turbine's blades spin which captures energy. This energy is then sent through a gearbox to a generator, which converts it into electricity for the grid, ...
