How much wind power does Suriname need?

A penetration of at least 23% of wind power in the electricity mix would therefore be technically feasible and economically advantageous for Suriname under the above assumptions, even without demand response and storage measures. 4.3. Sensitivity analysis

Could a new wind turbine be installed in Suriname?

As potential wind turbine deployment in Suriname would presumably happen in stages, the costs for each consecutive project could realistically be lower than for preceding projects as technology progresses and wind turbines with higher hubs (reaching higher capacity factors) become cheaper, allowing for penetration rates potentially beyond 30%.

Can Suriname support a grid integration of wind power?

Suriname's hydropower plant can support substantial grid integration of wind power. Thermal power could be cost-effectively displaced by hydro-supported wind power. Suriname could, on average, reach 20%-30% penetration of hydro-supported wind power. Such strategies could benefit various island states and regions with isolated grids.

Is a 20-30 percent wind power penetration possible in Suriname?

Based on this sensitivity analysis, it can be asserted that a penetration of 20-30% of wind power in Suriname's electricity mix would be technically feasible and economically advantageous even without advanced flexibility measures such as demand response and/or battery deployment.

Considering the trade-off between displacing expensive fossil fuels and limiting wind power curtailment on Suriname's island-like grid, our results suggest that integrating wind power in ...

We investigate the use of wind turbine-mounted base stations (WTBSs) as a cost-effective solution for regions with high wind energy potential, since it could replace or even outperform ...

Given conservative cost estimates for wind power and historically observed fuel costs for thermal power, displacing thermal with wind would remain economically advantageous up to wind ...

Wind power costs for Suriname communication base stations

This article aims to reduce the electricity cost of 5G base stations, and optimizes the energy storage of 5G base stations connected to wind turbines and photovoltaics.

Discover how hybrid energy systems, combining solar, wind, and battery storage, are transforming telecom base station power, reducing costs, and boosting sustainability.

Can wind energy be used to power mobile phone base stations? Worldwide thousands of base stations provide relaying mobile phone signals. Every off-grid base station has a diesel generator up to 4 kW ...

We therefore conclude that planning for the deployment of coastal onshore wind power, with up to at least ~ 200 MW of total capacity given current demand levels, represents a no ...

This is the Energy Report Card (ERC) for 2023 for Suriname. The ERC also includes sectoral data and information on policies and regulations; workforce; training and capacity building; and related areas.

Scenario 1: Business as usual (BAU) The first scenario is the business as usual scenario. The cost and the demand have been the same as the actual situation currently in Suriname.

This paper discusses the potential of hydro-supported wind power integration in Suriname, exploring hourly-to-multiannual resource complementarities and pathways towards high wind power ...
