The terms "wind energy" and "wind power" both describe the process by which the wind is used to generate mechanical power or electricity. This mechanical power can be used for specific tasks ...

The wind power generation process is divided into three main stages: 1. Wind Energy Capture. Turbine blades, designed aerodynamically, capture wind energy. Factors such as wind ...

In terms of configuration, wind power generation system normally consists of wind turbine, generator, and grid interface converters where the generator is one of the core components.

Overview Wind power capacity and production Wind energy resources Wind farms Economics Small-scale wind power Impact on environment and landscape Politics In 2024, wind supplied over 2,494 TWh of electricity, which was 8.1% of world electricity. To help meet the Paris Agreement's goals to limit climate change, analysts say it should expand much faster than it currently is - by over 1% of electricity generation per year. Expansion of wind power is being hindered by fossil fuel subsidies.

Areas are grouped into wind power classes that range from 1 to 7.
